## **Continuation Sheet (PTO-303)**

Continuation of 3. NOTE: The proposed amendment of "each pixel of each two dimensional image is displayed alternately with each corresponding pixel of the images of the remainder of the plurlaity of two dimensional images" would require further search and consideration. With respect to 49, applicant argues where the prior art fails to teach wherein the three dimensional image forming means has a region in which position information used for controlling the positions of incidence of the light emitted by the two dimensional image forming means is recorded. Examiner, respectfully disagrees. Travis teaches in col. 3, lines 51-59 where different views of a subject are projected in different directions/angles from the apparatus, the different views corresponding to the different views of a three dimensional subject would be seen from different directions. In other words, lateral multiplexing is utilized such that the two eyes of an observer see different views because each eye observes from a separate position, and the views seen by the observer change as he moves his head around the display. However instead of conventional lateral multiplexing, where several views are presented simultaneously, the invention further utilizes time multiplexing. Thus, the different views are presented in sequence while the position from which the display is visible is adjusted, provided the angle between the views is sufficiently fine and the sequence of views is repeated at sufficiently short intervals, the image displayed the apparatus will appear smooth and three dimensional.
